Employee Self Service Milestone:

Description:

The executive steering committee wants to re-engineer and modernizing all the systems relates to Human Resources. There should only be one in-house database that is capable to store all employee master data. The new system should have a data security in place including upgrading the new servers and software. We envisioned intranet-based online directory and Employee Self-Service System (ESSS) to be developed.

The in-house database should be able to handle and cope with growing employee data size as the company hire more employees. This means there needs to be an operating system, servers, hardware and software upgrades.

Includes context diagram, a functional decomposition diagram, event decomposition diagram, event diagrams, merge event diagrams into a subsystem diagram and primitive data flow diagram to create communications plan and to make better decision prior to system requirements.
